

Abstract of the Disclosure:

To provide the functional and setting parameters required for operation of a telecommunications terminal, as well as general telecommunications data and individual user data independently  
5 of the operation of the telecommunications terminal, the invention stores the data, functional, and setting parameters on a Universal Serial Bus memory stick, which can be connected to the telecommunications terminal through a USB interface. The functional and setting parameters as well as other  
10 operating and individual user data can, in this way, be transmitted to another telecommunications terminal in the event of servicing, repair, or replacement so that no data is lost nor is any service technician required for setting up and adjusting the telecommunications terminal, with the  
15 telecommunications terminal *in situ*.
